

HEATING CABINET

FOR EYESPRAY EYEWASH

The cabinet could be placed close to the hazard area and will work independent from weather conditions.

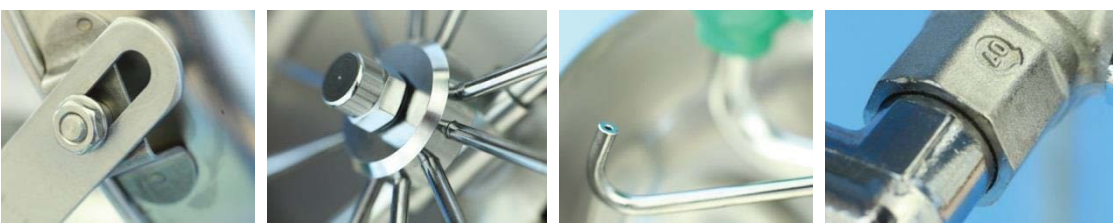

The eyewash is activated automatically by pulling the cover and letting it fall down. The shower is loaded with two spray bottles- each bottle contains a sterile 0,9% buffered sodium chloride solution.

The flushing time exceeds 15 minutes.

When the shower has been activated both your hands are free to keep your eyelids open while your eyes and face is flushed.

Require no adjustment to the water mains, which eliminates all eventual problems with Legionella bacteria.

A heating element and a thermostat will keep the temperature in the cabinet between 25-30 degrees Celsius independent from the temperature outside the cabinet.
